HIB

Industrial buildings by Honomobo

Site buildings that look like they were designed, because they were.

HIB makes steel-frame industrial modules for the companies that own and rent site fleets: washrooms, dry facilities, offices, gyms, staff suites, compute. Same factory and frame as Honomobo. A different customer, a different promise, its own name.

Where HIB stands

Honomobo is warm, quiet and residential — a home you choose. HIB is hard, precise and procured. The two share a parent and a production line, and nothing else visible.

What the market has

Sea-cans with a door cut in. Corrugated, rust-streaked, vinyl-lined, cold in January and loud all year. Priced as a commodity because it looks like one. Rental fleets accept it because nobody has offered them the alternative at scale.

What HIB offers

A flat, insulated, thermally broken steel module with proper doors, real windows where they belong, and a finish that still looks new after five moves. The fleet owner gets a higher day rate and a longer life. The people inside get a building that feels like it was meant for them.

The mark

Three heavy compressed letters and one vertical amber bar. The letters are the structure; the bar is the finish — the one deliberate detail on an otherwise plain surface. It scales from a lapel pin to a 50-foot wall.

Rules

- Bar always on the right, always amber, height matches the cap height of the letters.
- Graphite on chalk, or chalk on graphite. No other combinations.
- The endorsement "by Honomobo" sits below in zinc, never larger than a quarter of the mark, never in Honomobo's own typeface.
- Minimum clear space equals the width of the bar on all sides.

On the building

- One amber bar per module, full height, at the door edge — it doubles as the wayfinding strip and the brand.
- Wordmark once, near the corner, no larger than the door.
- No graphics, no stripes, no fleet-style sticker walls. The panel is the statement.

Colour

Steel, zinc and chalk do almost all the work. Amber is spent sparingly — one bar, one button, one highlight — which is exactly why it reads as premium instead of hi-vis.

Graphite
#1C2124 · cladding, mark, headlines

Zinc
#A7ADB2 · trim, secondary text, endorsement

Chalk
#F0F1F2 · interiors, page background

Amber
#E39A17 · the bar, the one accent

Steel blue
#3B5468 · diagrams, data, cooling

Type

One family, Archivo, used at two widths. Compressed and heavy for the mark and headlines — it reads like a stencil without being one. Normal width for everything you have to read.

Display · Archivo 800, width 70

Mine dry. Twelve lockers. Warm floor.

Heading · Archivo 700, width 88

Built for the fleet, finished for the crew.

Body · Archivo 400, width 100

Every HIB module is a welded steel frame with a thermally broken envelope, built in Nisku and delivered on a step deck. The same frame carries a washroom, a dry, an office or a data hall.

Labels · Archivo 500, 13px, sentence case

Shipping height 11'6" · Floor 250 psf · R-24 walls

- No all caps, ever — the compressed weight does the shouting.
- Numbers and specs in the same face, never a monospace.
- Sentence case on everything, including product names.

Voice

HIB talks like a good site super: short, specific, unbothered. It states the spec and lets the building sell itself.

Sounds like HIB

- "Insulated to –40. Floor rated 250 psf. Ships Tuesday."
- "Twelve lockers, two showers, a boot dryer that works."
- "Same building on its fifth site. Still square, still sealed."
- "Built in Alberta. Docked anywhere."

Doesn't

- "Revolutionizing the modular space" — no category talk.
- "Luxury" or "elevated" — premium is shown, not claimed.
- "Solutions", "innovative", "cutting-edge".
- Anything a sea-can company could also say.

Product families

One naming system for everything: HIB, a plain-English family name, a number for size or capacity. Buyers should be able to spec a unit from the name alone.

HIB Wash

Commercial and site washrooms. The BOXX work, productized.

Wash 4 · Wash 8 · Wash 12

By fixture count. Rental fleets, events, camps, municipalities.

HIB Dry

Mine dry and change facilities. Heated floor, lockers, showers, boot room.

Dry 12 · Dry 24 · Dry 48

By locker count. Mining, oil sands, heavy construction.

HIB Work

Site offices, lunchrooms, first-aid and training rooms.

Work 8 · Work 12 · Work 20

By seat count. Contractors, fleet owners, project sites.

HIB Gym

Gyms and wellness modules for camps and remote sites.

Gym 1 · Gym 2

By module count. Camp operators, mines, energy sites.

HIB Suites

Staff accommodation, suite-style. Not dorms — that's a partner's business.

Suites 2 · Suites 4

By suite count. Resorts, operators, senior site staff.

HIB Compute

Insulated data hall modules, shell or fitted.

Compute 200

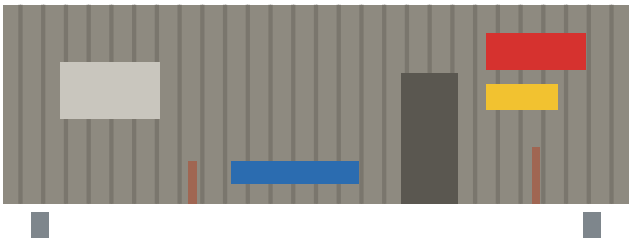

By kW. Integrators, telcos, Alberta compute developers.

How it looks on site

The visual language is the module itself: flat graphite panel, one amber bar at the door, zinc trim. Nothing else.

HIB Dry 24 — door end. One window band, one bar, one mark.

The standard offer. Buyers know exactly what this costs — and looks like.

	Standard container	HIB
Envelope	Corrugated, spray or batt inside, bridged everywhere	Flat panel, thermally broken, R-24, airtight
Size	8' wide, 8'6" tall	Up to 14' wide, 11'6" tall, on a step deck
Finish	Painted steel, dents and rust by year two	Factory-finished panel, colour-matched repairs
Brand on the wall	Fleet stickers	One bar, one mark
Day rate	Commodity	Premium, justified on comfort and lifespan

Photography and renders

Overcast light, wide frames, the module in a real landscape — muskeg, a laydown yard, a mine bench. People in the frame, not posed. Never a white studio background, never a drone shot from directly above. Interiors shot warm to prove the point about being inside one in February.

Working direction, September 2026. Accent confirmed amber. Name is a placeholder; the system works with any three-letter mark. Fonts: Archivo (open licence). Nothing here uses Honomobo's typeface, colour or photography style — that separation is the point.
